

The **must** and **must not** are used to express a strong obligation or prohibition.

We **must** wear a seat belt when driving. You **must not** drink and drive.

I **must** finish my homework before I can go out.

The car **must** be insured. The company **must** provide a safe working environment.

I **must** finish my homework before I can go out. You **must** wear a seat belt when driving. We **must** finish our own conclusions from the data.

You **must** finish your homework before you can go out. The company **must** provide a safe working environment.

Take care of your health. **Do not** smoke. **Do not** drink and drive. You **must** finish your homework before you can go out.

It is not possible to have a single, universal definition of a "must" statement.

The term "must" is used in many different contexts, such as in law, ethics, logic, and everyday language. For example, in law, "must" often refers to a legal obligation, while in ethics, it refers to a moral requirement.

Therefore, the meaning of "must" is highly dependent on the context in which it is used. In the context of AI, "must" often refers to a requirement or a constraint that the AI system must follow. For example, an AI system might be required to follow a set of rules or to provide a certain level of accuracy.

For example, an AI system might be required to follow a set of rules or to provide a certain level of accuracy.

When we say that an AI system "must" do something, we are typically referring to a requirement or a constraint that the system must follow. This is often used in the context of AI ethics and safety. For example, an AI system might be required to follow a set of rules or to provide a certain level of accuracy. This is often referred to as "referencing".
